From the table on page 258 it will be seen that in the twenty reservoirs under consideration 1065 soundings were taken, and that the aggregate area of the water-surface is about 3 square miles, so that the average number of soundings per square mile of surface is 355. The aggregate volume of water contained in the reservoirs is estimated at about 998½ millions of cubic feet. The area drained by these reservoirs is 43⅔ square miles, or about 14 times the area of the lochs.
