

The details regarding the lochs in the Inver, Roe, Kirkaig, Polly, and Garvie basins are collected together in the following table for convenience of reference and comparison. Where the elevation above the sea was not determined by levelling from bench-mark, the approximate elevation is given in brackets; in the case of Lochs Urigill, Càrn, Lurgain, and Owskeich, the Ordnance Survey level is given with an indication of the date when levelled.

From this table it will be seen that in the twenty lochs under consideration, 2540 soundings were taken, and that the aggregate area of the water-surface is over $12\frac{1}{2}$ square miles, so that the average number of soundings per square mile of surface is 200. The aggregate volume of water contained in the lochs is estimated at about 20,355 millions of cubic feet. The area drained by these lochs is about $150\frac{1}{2}$ square miles, or twelve times the area of the lochs.
